

CapTracker

The Complete Guide

Everything about the capacity & delivery tracker:
who uses it, every screen, every rule, and every workflow —
explained step by step, with illustrations.

Edition: July 2026 · covers the app as deployed at captracker.alphasights.ae

Compiled from the live codebase — every number in this guide is the value the code actually uses.

What is CapTracker?

CapTracker (code name “Relay”) is AlphaSights' internal capacity & delivery tracker. It answers three questions the team used to answer with a shared spreadsheet and gut feel: Who should take the next project? How is every live project actually progressing? and Who is free right now? It runs at captracker.alphasights.ae, works on desktop and phones, and updates every open screen live over WebSockets — when someone logs a delivery, every colleague's board refreshes within a second, with a pop-up, a red bell and a gong for the people it concerns.

The cast — four kinds of user

OWNER

Kai, Garima, Sahad. Everything managers can do, on every team + the User Management portal. Guaranteed by an email allowlist — can never be locked out.

MANAGER

Runs one team: sets members' status (available / sick / vacation / offline), adds & removes team members, edits their team's projects, sees the Audit Log.

MEMBER

Everyone else. Manages their own work: logs deliveries, accepts broadcast seats, requests goal changes, toggles their own evening coverage.

GHOST

A member flagged as “invisible competition” (intern / new joiner). Works real assignments whose numbers never count toward project totals. Page 8.

How you get in — two locked doors, one key

Access is defence-in-depth: Cloudflare Access stops anonymous traffic at the network edge, then the app runs its own sign-in. Both doors use the same Okta account, so after the first door your Okta session opens the second automatically — you type your password once.

Deactivated accounts are refused at the app door even if Okta lets them through the first one; the three owner emails are re-granted Owner on every login, so an accidental demotion can never lock the founders out.

Projects, angles, assignments

Everything in CapTracker hangs off one shape. A PROJECT is the client engagement. It always contains at least one ANGLE — a workstream with its own call count (N), its own profile goal and its own calls-sold tally. Each angle holds ASSIGNMENTS — one per deliverer staffed on it, carrying that person's personal goal, delivered count and stage. A “simple” project is just a project with a single angle; nothing special.

Project types set the maths (page 6): Pitch, Due Diligence, or Strategy. Client entity (1–5) colour-tints the card header so a board groups visually by client. Every deliverer moves through four STAGES — First Deliverable → Second Deliverable → Hail Mary → Selling — and the stage drives how heavily their remaining work weighs on them (page 6).

A project's life

Deleting a project is always a SOFT delete: the row is stamped deleted_at and vanishes from every screen and query, but nothing is destroyed — an owner can recover it in the database. There used to be a fourth status, “idle”; it was retired in July 2026 and any parked projects became active again.

One project, end to end

This is the loop the whole app exists for. Orange is the PL's path, teal is the deliverer's, amber is what the system does by itself.

Every mutating step above lands in the Audit Log with who, what, old value and new value — and every arrow that changes someone's world also fires a notification to exactly that person (page 9).

Who gets suggested — the maths

Step 1 · Eligibility — three hard rules

Status must be Available

Sick, On vacation and Offline are never staffable, at any hour.

Sunday? Rota only

On a Dubai Sunday only people on today's Sunday rota are eligible.

After 19:00? Volunteers

After hours, only people with Evening coverage switched on.

Step 2 · Load — the ranking signal (lowest goes first)

load = Σ over assignments: remaining profiles $\times$ stage weight $\times$ pool weight (this hour)

Stage weight — early work weighs double

First Deliverable	$\times 2$
Second Deliverable	$\times 1$
Hail Mary	$\times 0.5$
Selling	$\times 0$

Pool weight — follows the Dubai clock

Global · EU & MEA & India	$\times 1$ all day
AUS / NZ / Sing / JP	$\times 2$ before 15:00, $\times 0$ after
US only	$\times 0$ before 15:00, $\times 2$ after
Pitch with 0 calls agreed	flat pin: load = 1

“Free” has its own simpler test: your raw remaining profiles (unweighted) at or below the org-wide median. Free + practice-area match beats the queue — the soft rule prefers a free person from the PL's own practice area before pure load order.

Step 3 · Suggested goals & seats — from the call count N

Pitch, 0 calls

goal 8 · 1 seat

a preview list, load pinned flat

$N \leq 2$ calls

goal = $N \times 3$

small projects oversample

$N > 2$ calls

goal = $N \times 2$

Pitch & Strategy standard

Due Diligence

goal = $N \times 3$

sourcing is harder — always heavier

Two guard rails: the FIRST-DELIVERABLE BLOCK auto-skips anyone already carrying a First Deliverable for a Strategy/DD project whose pool is live right now (you can still pick them manually — with a justification). And revising an angle's goal below the suggestion is allowed but lands in the Audit Log as a downward revision.

The boards you'll live in

- **Project Leading**
your projects as PL, grouped by client-entity tint. Cards show goal progress, per-angle totals, stage pills, timers; actions: edit team, edit project, notes, log sold, archive.
- **Delivery**
the same cards from the deliverer's seat: your goal, your progress buttons, your current load, and the open-pool "up for grabs" list when a broadcast is running.
- **Capacity Ranking**
everyone, org-wide, sorted by load (lowest first = next up). Free/busy chips, practice area, team. This replaced the old shared spreadsheet.
- **Ghost Ranking**
identical table, filtered to ghost-flagged people only (page 8).
- **First Deliverables**
every assignment sitting in stage one, with elapsed timers: amber at 30 minutes, red at 60.
- **Audit Log (managers/owners)**
searchable who-did-what with old → new diffs for every change in the app.
- **User Management (owners)**
the roster admin portal (page 10).

One day on the Dubai clock

Sundays are special: only the Sunday rota works, managers edit the rota, and members can raise swap requests. The stale watchdog runs all day: an assignment stuck in First Deliverable with no progress fires an alert at every 30-minute mark — to the deliverer and to the PL.

The same app, two shapes

Desktop is a navy sidebar + wide boards; the phone gets a slim header, a navy bottom navigation bar in thumb reach, and a “More” sheet for everything else. Both share every feature — including dark mode, toggled with the moon/sun button next to the bell and remembered per device.

Desktop — navy sidebar, boards, collapsible archive

Mobile — bottom nav + corner button

The mobile “More” sheet carries Ghost Ranking, My Team, the Sunday rota, Audit Log, User Management, the evening-coverage switch and log-out — each a full-height touch row. The phone keeps every badge: pending PL approvals on Leading, first-deliverable count on 1st Del.

Invisible competition

Some angles benefit from quiet internal competition: an intern or new joiner working the same workstream as the real associate, without their numbers touching the client-facing totals. That person is a GHOST — flagged per person by their manager in My Team, reversible any time.

How a ghost gets staffed

The one rule that matters — what counts where

COUNTS normally

The ghost's own row: their goal, delivered, stage, timers. The angle's calls-sold (it was never derived from assignments).

NEVER counts

Project & angle roll-ups: total goal, total delivered, chase-client flag. A ghost can never inflate what the client sees.

Managers & owners are out of the running

Anyone with the Manager or Owner role is excluded from Capacity Ranking, Ghost Ranking, the org median and every auto-suggestion. They can still be staffed — both pickers have a separate “add a manager” section — but it is always a manual override with a written justification. Pitch angles never get ghosts; the per-angle toggle can switch the feature off for any DD/Strategy angle at intake.

Ghost Ranking is the same dashboard as Capacity Ranking pointed at the ghost pool — same load maths, same eligibility, visible to everyone.

How the app taps your shoulder

One event, four channels, all at once: the bell fills red with a count, a Chrome pop-up appears (even on other tabs), the gong sounds, and — if you opted in — a push notification reaches your device with the tab closed. Clicking any notification jumps straight to the board it is about. Everything is also stored, so the bell never loses history.

The seven triggers, and who they reach

New project assigned to you	you were staffed: auto-match, manual add, a swap, or your broadcast claim	deliverer
Project up for grabs	a project starts with zero eligible people — first to accept takes a seat	everyone eligible
Seat claimed from the broadcast	one of your broadcast seats was just taken	the PL
Delivery logged — review	a deliverer logged progress on your project	the PL
Goal change requested	a deliverer asked for a new goal / status	the PL
Request accepted / declined	your goal-change request was resolved (accepting applies it)	deliverer
Still on First Deliverable	30-minute stale alerts, repeating each half hour mark	deliverer + PL

Reliability details you never see: if your connection blips (or the app redeploys), the bell re-syncs the moment it reconnects, so nothing is lost; on phones the pop-up automatically falls back to the system notification card. The bell stays grey when there is nothing unread — red always means action.

User management & the audit trail

The User Management portal (owners only)

One screen to run the roster: search anyone; change their role (Owner / Manager / Member); assign their team; set their status; edit name and practice area inline; deactivate (they cannot sign in, history preserved) and reactivate; pre-provision a colleague by email so their role and team are ready the moment they first sign in with Okta. Every action here is audit-logged, and the three founder emails are protected — the portal refuses to demote or deactivate them.

The Audit Log — the memory of the app

Every change is recorded with the actor, the action, the entity and an old → new snapshot: project edits, goal updates and downward revisions, staffing overrides with their justifications, stage moves, role changes, deactivations, ghost flags, broadcast claims, goal-change outcomes. Managers and owners can filter it by person, entity type, action and date range, and expand any row to see the exact before/after values. If a number on a board ever looks surprising, the audit log answers “who changed this, when, and from what?” in seconds.

Goal changes — the request loop in miniature

Declining applies nothing but still notifies and logs. Double-clicks are harmless — a request can only resolve once.

How it runs (the two-minute tour)

Live updates ride a WebSocket from the API; the boards never poll. The server is the only place rules are enforced — hiding a button in the UI is never the security boundary.

How changes ship

Small print worth knowing

- Sessions last 7 days; signing out kills the cookie immediately.
- The database is never edited by the app in place — schema changes are numbered migrations that run exactly once, in order, on deploy.
- Deletes are soft; archives are reversible; the audit log is append-only.
- Dark/light theme, the gong on/off and your sound choice live per device, not per account.

Want deeper technical docs (deploy runbook, environment variables, incident recovery)? They live in the repo: CONTRIBUTING.md and docs/ — this guide deliberately stays on the “using it” side of the line.

Glossary & quick answers

Angle	one workstream inside a project; owns N, a goal and calls-sold
Assignment	one deliverer's seat on an angle: personal goal, progress, stage
N	calls agreed with the client — the seed for every suggested goal
Load	Σ remaining $\times$ stage weight $\times$ pool weight; lowest load is next up
Free	raw remaining profiles at or below the org median
Broadcast / open pool	an unstaffed project offered to everyone eligible, seat by seat
Override	manually picking someone the ranking didn't suggest — needs a reason
First-deliverable block	auto-skip for people already on a live-pool First Deliverable
Ghost	deliverer whose numbers never enter project totals (invisible competition)
Evening coverage	your own after-19:00 availability switch
Sunday rota	who works a Dubai Sunday; manager-run, swappable
Calls-sold	per-angle tally the PL confirms every morning
Custom delivered	profiles sourced outside the system — still count toward the goal
Soft delete	hidden everywhere, recoverable in the database

“How do I...?” in one line

...create a project?	New project (sidebar / mobile +) → intake wizard → accept or override the picks.
...log my delivery?	Delivery board → your card → progress buttons; the PL is notified automatically.
...change my goal?	Your card → request goal change → the PL accepts (applies) or declines.
...go dark?	Moon button next to the bell. Sun brings you back.
...stop the gong?	Bell → Notification sound → Turn off (per device).
...see who changed X?	Audit Log → filter by entity or person → expand the row.
...add a colleague before they join?	User Management → Add user → email + role + team; ready at first sign-in.

That's the whole machine. Everything else is just using it.

Questions or ideas → the Audit Log knows what happened; the owners know why.
