

INTERNAL WORKFLOW REFERENCE

CapTracker

How the delivery capacity tracker works, end to end — roles, the project lifecycle, capacity matching, coverage, and the supporting systems.

AlphaSights • internal tool (~50 users) • also known as “Relay”
Stack: React + Fastify + PostgreSQL • Asia/Dubai working calendar

1. What CapTracker is

CapTracker replaces a shared spreadsheet for running expert-call delivery. A **Project Lead (PL)** takes a client engagement, and one or more **deliverers** source and deliver expert **profiles** against it; the goal is to convert those into **calls sold** to the client. The app decides *who should be staffed next* from a live capacity signal, tracks progress through delivery stages, and keeps everyone coordinated with notifications, coverage prompts, and a full audit trail.

Two vocabulary anchors used throughout:

- **N** — the number of expert calls the client wants (the ceiling of what can be sold).
- **Profiles / delivered** — candidate experts a deliverer sources; some convert to sold calls.
- **Angle** — a workstream within a project; a project always has one or more angles, and staffing happens per angle.

2. Who uses it

Role / hat	What they do
Owner	Full control incl. Settings (user management + coverage timings). Founders are allowlisted and can never be locked out.
Manager	Team-scoped control: rosters, statuses, ghost flags, Sunday rota, and their own projects.
Member	A regular user — acts as a PL on projects they lead and/or a deliverer on angles they're staffed on.
Project Lead (PL)	Owns a project: sets it up, staffs the team, records calls sold, manages stages and archive. (A hat, not a role tier.)
Deliverer	Staffed on an angle: logs profiles delivered (system + custom) and moves through delivery stages.
Ghost	"Invisible competition" — a shadow competitor on a Due-Diligence / Strategy angle; visible to all but excluded from roll-ups.

3. The core objects

Project -> Angle(s) -> Assignments is the backbone. Everything else hangs off it.

Object	Key attributes
Project	Client, topic, PL, type (Pitch / Due Diligence / Strategy), expert pool, lifecycle status (open / active / archived), client-entity grouping.
Angle	Name, N (calls), goal (profiles), calls sold, its own expert pool, archived flag. Totals shown at project level are sums across angles.
Assignment	A deliverer on an angle: their goal, delivered (system) + custom-delivered, and their own stage. Ghost assignments are marked and excluded from roll-ups.
Note	Per-project note shown on cards and in the to-do box; editable, deletable, mark-done.
Personal reminder	Your own free-text to-dos (Settings-independent) in the to-do box's Admin section.

Project types size the work differently (a Pitch with no agreed calls gets a small preview list; Due Diligence is weighted heavier than Strategy at the same N). Expert pools — Global, EU & MEA & India, AUS/NZ/Sing/JP, US only — carry a time-of-day

weight so work is pushed to whoever's region is "live" right now.

4. The end-to-end project workflow

1

Intake

A PL creates a project through the intake wizard: client, type, expert pool, and one or more angles each with an N and a suggested goal.

2

Auto-staffing (matching)

The app ranks eligible people by live capacity load (lowest first) and auto-assigns deliverers to each angle, honouring pool/region and a first-deliverable conflict rule.

3

Broadcast fallback

If nobody eligible can be auto-staffed, the angle goes "up for grabs": it broadcasts to a wide net and re-pings every 15 min. First to Accept claims a seat.

4

Manual staffing

A PL can staff directly via Edit team (and add ghosts on DD/Strategy). Once every angle hits its seat target — by claim or by hand — the project flips open -> active and drops off the broadcast.

5

Delivery

Deliverers log profiles as they source them: "from our system" and "custom sourced", both counting toward their goal. Progress bars and pace update live for everyone.

6

Calls sold

The PL records calls sold per angle (a morning prompt nudges any project not updated today). Calls sold vs N drives the client-facing outcome and the market-share pulse.

7

Stages

Each deliverer moves through First Deliverable -> Second Deliverable -> Hail Mary -> Selling (Admin). Stage sets the urgency and the capacity weight; a stalled First Deliverable is chased automatically.

8

Archive / close

When done, the PL archives the whole project, or "for deliverers only" (off their boards, still live on the PL board for selling). Delete is a soft-delete — history is never lost.

5. Capacity ranking & how matching decides

The heart of the app is a single, shared capacity signal — the same computation the matching engine, the ranking screen, and the team panels all read (never re-invented).

Load — the ranking signal (lower = staffed next)

load = remaining profiles × stage weight × expert-pool weight for the current Dubai hour. Stage weights: First Deliverable 2, Second 1, Hail Mary 0.5, Selling 0. A person with the lowest load is first up.

Eligibility — who's even in the running

Someone is excluded from new allocation when any of these hold:

- Status is Sick or On vacation, or they're Offline.
- They're **Out to Lunch** (self-serve toggle; auto-clears after a configurable window).
- It's after hours and they haven't opted into **evening coverage**.
- It's Sunday and they're not on that day's **Sunday rota**.
- A **first-deliverable conflict** — they're already mid first-deliverable elsewhere.

Expert-pool weighting means an angle's work is heaviest when its region is live (e.g. US pool wakes up in the afternoon Dubai time, APAC winds down) — so the right people get surfaced at the right hour without anyone manually re-balancing.

6. Coverage & availability

Mechanism	How it works
Out to Lunch	Self-serve toggle. While on, no new allocations and a red "Lunch" chip on the ranking. Auto-switches off after a configurable window (default 1 hour).
Evening coverage	Voluntary after-hours availability. A weekday-evening prompt asks "free to cover tonight?"; opt-ins reset each morning before the working day.
Sunday rota	A BU-wide schedule of who's on each Sunday. Anyone not rostered is treated as offline that day; members can request a swap.
Daily prompts	Lunch and evening prompts appear inside configurable weekday windows; Yes flips the toggle, No parks it for the day, Remind snoozes it.

All of these timings — the lunch and evening prompt windows, the lunch auto-off duration, the morning reset, and the snooze lengths — are owner-editable under **Settings -> Coverage settings**, read live by both the prompts and the server, so a change applies to the whole BU with no redeploy.

7. Supporting systems

Invisible competition (ghosts)

On Due-Diligence / Strategy angles a PL can add ghost deliverers — shadow competitors that render like any deliverer but are excluded from goal / progress roll-ups. They create healthy pressure without a real person knowing they're the benchmark.

Notes & the to-do box

Every project carries notes, shown on both the PL and Delivery cards (editable, deletable, mark-done — one note, one source). A docked to-do box collects them into three sections: **Delivery** (projects you deliver on), **PLing** (projects you lead), and **Admin** (your own manual reminders).

Monthly market-share pulse

Under Project Leading, a live bar shows calls sold ÷ N for the current month across My / Team / BU scopes. Tiers: under 33% red, 33–50% yellow, 50–75% green, 75%+ gold. It deliberately counts deleted projects too, so the number reflects everything that actually happened that month.

Notifications & live updates

A shared realtime socket keeps every board current: most events are tiny "something changed" signals that trigger an authorized refetch, while personal notifications (assigned, delivery logged, goal-change, stalled, transfer) reach only their recipient and ring the bell.

8. Delivery stages (reference)

Stage	Meaning	Load weight
First Deliverable	The initial push — most urgent; a stall here is chased automatically.	2.0
Second Deliverable	The follow-up round after first feedback.	1.0
Hail Mary	A last effort to convert remaining demand.	0.5
Selling (Admin)	Delivery done; closing / selling the remaining pipeline.	0.0

9. Security & operations (at a glance)

- **Access** — Cloudflare Access (Zero Trust) wall in front, then OIDC SSO (Authorization Code + PKCE). No passwords in the app.
- **Sessions** — signed, httpOnly cookies with a 12-hour idle timeout, a 7-day absolute cap, and server-side revocation ("log out everywhere" / instant deactivation).
- **Authorisation** — enforced server-side on every route; owner-only admin; team-scoped manager powers; per-resource PL ownership.
- **Auditability** — every mutation writes an append-only audit log (who changed what, old -> new).
- **Pipeline** — six CI gates (secret scan, dependency + image scan, static analysis, server + web build/test) block a merge; merge to main builds images and deploys to the GCP VM behind a Cloudflare tunnel.

This document describes behaviour as built. Exact prompt windows, coverage timings, and thresholds are configurable; see Settings -> Coverage and the security configuration reference for specifics.
